

YARD WASTE: It's That Time Again!

Dear Resident:

Did you know in Illinois?

- Landscape waste that is intended for collection or disposal at a landfill cannot be mixed with any other waste;
- Landscape waste cannot be knowingly put in a container intended for collection or disposal at a landfill;
- Landfills' can only accept landscape waste if it operates a composting facility?

Beginning Thursday, April 5, The Roy Strom Company, the Village's selected waste collection hauler, will begin

collecting yard waste material. Residents, under the Village's program, are required to place **Yard Waste Material: grass, leaves, plants, weeds, tree branches, shrubbery, etc., not exceeding 4 inches in diameter, 4 foot in length**, out for pick up next to their refuse container(s) on their regularly scheduled collection day, **THURSDAY**. **Yard Waste** is to be placed in a 32 gallon size biodegradable yard waste bag, or may be placed in a conventional refuse container (32 gallon size). **Containers should be marked to indicate they contain Yard Waste Only. Please place a very visible (YW) or (Y) on each container set out containing yard waste material.** Only Yard Waste may be placed in those containers and, or bags and the containers or bags should not exceed a weight of 60 pounds each! Tree trimmings (4' in length or less), brush etc., may also be placed out in bundles tied with twine/string. The bundles should not exceed 50 pounds in weight.

The use of plastic bags for the disposal of yard waste is prohibited because the bags clog tub grinding equipment and do not break down during the composting process.

Compost facilities will not accept material delivered in plastic bags or loads containing plastic debris in them.

To assist residents better manage their yard waste, and help our environment the following information on "**GRASSCYCLING**" is provided for review.

Printed on recycled paper

WHY BAG YOUR GRASS CLIPPINGS?

Lawn care is hard work, and bagging lawn clippings is one of the most time consuming parts of the job.

The bigger your lawn, the more clippings, the more yard waste bags or cans you have to fill, the more exhausting the process.

Now, consider for a moment not bagging your grass. Gone are the hassles of stopping every few minutes to empty the lawnmower bag, raking, wrestling with expensive yard waste bags. Instead your clippings are working their way back into the soil.

You may have heard, not bagging your grass is unhealthy for your lawn. Excessive thatch build-up may result, which in turn may damage the lawn. The fact is thatch is not made up of grass, but of roots, dead leaf sheaths, and rhizomes which decompose slowly. Grass clippings decompose rapidly, and can help make your lawn more vigorous and durable. **DID YOU KNOW:** clippings contain nutrients? Every bag of grass clippings contains up to 1/4 pound of usable organic nitrogen. Fertilizing costs can actually be reduced by "**GRASSCYCLING**" clippings back into the lawn!

"GRASSCYCLING" Is Good For Your Lawn/ the Environment

Here is a point to consider when debating the value of recycling grass clippings. Franklin and Associate's in 1992, in a Characterization of Municipal Solid Waste Report prepared for the USEPA's Office of Solid Waste, indicated over **35 Million** tons of yard waste material is generated in the Municipal Solid Waste Stream. It **literally costs millions of dollars and thousands of gallons of precious fossil fuel** each year to collect and process this material.

To avoid the work, cost, and the adverse environmental impacts that result when grass is collected, not to mention the time wasted collecting grass clippings, why not consider "**GRASSCYCLING.**"

DON'T LET IT ALL GO TO WASTE!

Reduce.
Reuse.
Recycle.

"GRASSCYCLING Facts"

Saves Time

A study, conducted in Fort Worth, Texas, showed that 147 homeowners who quit bagging their clippings mowed their lawns, on the average, 1.4 times more each month than when they cut the grass shorter and collected the clippings. **However, the study also reported the homeowners saved an average of 35 minutes per mowing by not bagging!** After six months of not collecting lawn clippings, the study group **saved** an average of **7 hours of yard work.**

Thatch

Clippings do not cause thatch. Detailed research studies have shown that leaving clippings contributed only 0.03 inch to the thatch layer each year.

Lawn Disease

Grass clippings do not spread lawn disease. Watering, fertilization and the sharpness of your mower blade have a much greater influence on the occurrence of disease than "**Grasscycling.**"

Saves Money

During summer months, grass clippings can account for up to a whopping **50%** of residential trash! (Collection and processing costs for grass clippings can easily **exceed \$35 to \$40** a ton.) It seems senseless to pay to grow it, pay to maintain it, and then pay to throw it away! Keeping your lawn clippings out of the collection truck saves money and protects the environment.

Any lawnmower can "Grasscycle"

Special equipment is not necessary to "**Grasscycle**". However, manufacturers' have attachments that improve a mower's "**Grasscycling**" performance.

"Grasscycling" is environmentally responsible

Turf grasses are environmentally important. They cool and clean the environment, protect soils and groundwater, and absorb noise and carbon dioxide while providing beautiful recreational surfaces. Currently, landscape waste, including grass clippings, account conservatively for about **15% to 20%** of all curbside waste. "**Grasscycling**" provides an opportunity to positively impact the environment and be part of the solid waste solution.

Successfully recycling grass clippings back to your lawn requires only the kind of attention all lawns should receive on a regular basis.

"**GRASSCYCLING**" is not an all or nothing proposition. You may choose to collect your clippings every third time you mow, or every other time. Regardless, you're creating a savings for you and helping the environment. If you want to collect clippings occasionally, recycle them as mulch in the garden or planting beds. Mulching adds nutrients to the soil, reduces weed problems, modifies soil temperature, and retains moisture. Mulch also helps maintain good soil structure and minimizes erosion by protecting the soil surface.

"GRASSCYCLING" Tips

Mow your grass when it is dry and 3" to 4" tall. Never cut it shorter than 2" to 2 1/2" in height. This height will allow your lawn to have a larger and deeper root system-creating a stronger defense against weeds or draughts.

Use a **sharp mower blade**. A sharp blade and frequent mowing will mean finer clippings that decompose quickly.

Watering the lawn is extremely important. Clay soils will hold enough water to supply a healthy lawn for five to seven days. Irrigate in the early morning hours before sunrise or before leaving for work in the morning.

Fertilize properly. **Avoid over-stimulating the lawn with excessive amounts of fertilizer in the spring.** This promotes overly abundant top growth and causes weakening of turfgrass.

Limit the use of chemicals. Save money and allow soil organisms to return nutrients to the soil by first correctly diagnosing lawn problems and then applying corrective measures only when needed.

Remove excessive thatch before leaving your lawn clippings on the lawn. Although a 1/2 inch of thatch is no problem, a thick layer will keep clippings from reaching the soil.

Avoid mulching using grass that's recently been treated with herbicides which can harm your plants. Chemically treated clippings should be left on the lawn or in your compost bin, where herbicides will breakdown in about six weeks.
